

fossæ ; these fossæ looked almost directly inwards, the wings and the anterior border of each ilium approached the vertical in direction, and the crest was short. The distance between the anterior inferior spines was 161 mm., only 13 mm. less than that between the anterior superior spines. The breadth of the pelvis was restricted in relation to the height, so that the breadth-height index was as much as 91. The obturator index was 75·5, which expresses a relatively wide obturator foramen. The transverse diameter of the pelvic brim was markedly below the conjugate, and the shape of the inlet was oval in the antero-posterior direction ; the pelvic index was 109. The intertuberal diameter corre-

TABLE VI.—GUANCHE AND BUSH.
