REPORT on the HUMAN CRANIA AND OTHER BONES OF THE SKELETONS collected during the Voyage of H.M.S. Challenger, in the Years 1873-76. By SIR WILLIAM TURNER, Knt., M.B., LL.D., F.R.SS. L. & E., Professor of Anatomy in the University of Edinburgh, Foreign Member of the Anthropological Society of Paris.

**PART II.—THE BONES OF THE SKELETON.**

THE Crania having been described in the First Part of this Report (Zool. Chall. Exp., part xxix., 1884), I shall now proceed to the consideration of the characters of the other bones of the skeleton. In my inquiries into this division of the subject, as in the study of the crania, I have not restricted myself to the examination of the bones brought home by the Challenger. I have also studied a valuable series of human skeletons of various races, some of which have been for a long period in the Anatomical Museum of the University of Edinburgh, having been collected by my predecessors in the Chair of Anatomy, Professors Alexander *Monro tertius* and John Goodsir, whilst others have been obtained by myself during the last twenty years.

In the course of this inquiry I have also consulted the previous literature on the same subject, so far as I have had access to it, and have endeavoured, as far as the material at my command would admit, to make this part of the Report an essay on the Comparative Osteology of those Races of Men whose bones are described in this Report.
